

THE BLUE ONES FROM ROSTA

Components for increased output

Simple and clever

DEAR READER

A unique success story for 75 years

Thanks to an innovative product idea, ROSTA is the world's leading manufacturer of rubber spring and damping systems. Since 1944, our consistent customer-centric approach has had top priority and contributes significantly to the sustained success of the company – enabling us to celebrate the 75th anniversary of our success story in 2019.

In addition to our headquarters and production site in Switzerland, ROSTA has 6 subsidiaries in Germany, Italy, Canada, the USA, China and Australia with over 120 employees. Our global network with over 30 partners in more than 40 countries positioning us to serve our customers far beyond our borders swiftly and promptly.

Many customers from all industries already benefit from our comprehensive know-how, becoming more profitable and competitive thanks to ROSTA products.

Our components are maintenance-free, noiseless, have a long service life and are used for a wide range of applications. Many years of experience in research and development in our own laboratory and the collaborative work with our partners and customers form an important knowledge base from which we can continue to offer innovative solutions.

Perfect combination

ROSTA GROUP

ROSTA – yesterday, today, tomorrow

It began in the mid-1940s with the construction of rubber-mounted trailer axles. This laid the foundation for the ROSTA success story.

Over the years, ROSTA has developed components that have found countless uses in mechanical and plant engineering.

Even today, new applications for the ROSTA rubber suspension element are constantly being realised.

New technologies and an innovative culture at ROSTA will enable the future development of new components with new materials.

OVERVIEW OF ROSTA

History

It began with the search for a simple and inexpensive solution for a trailer: to absorb, dampen and support the axle.

Production

In the end, the ROSTA rubber suspension element is only as good as the rubber inside. Many new possibilities are developing for the improvement of the quality and production of rubber inserts for specific and/or customized applications. This is possible through collaboration with our «own» rubber manufacturer.

Functions

Let yourself be inspired by the wide range of application possibilities for our rubber suspension elements! Tensioning, dampening and supporting are characteristics that require a solution in almost every technical design.

Employees

At ROSTA, we have the best employees. Mutual respect and a friendly atmosphere make our company one big family.

Industries

It started with the axle suspension for a single industry. Today, ROSTA elements are used for countless applications in many different industrial branches. Every day we find new solutions that make our customers more competitive and profitable.

Distribution

Over 30 sales partners advise and support our customers worldwide. Our aim is to work with the best distributors around the world. We train them professionally so they can support their customers in the respective country without delay.

- 1944: Foundation
- 1968: First machine components
- 1978: Own laboratory
- 1992: ISO certification
- 2007: Acquisition Compounds AG
- 2019: Automated manufacturing

75 years of customer-oriented innovation

- Own rubber manufacturer
- The ability to adapt to changing customer and market needs
- Consistently high quality
- Lean Management / 5S
- Core competence in developing complex customer solutions

1.5 million elements sold each year

- Tensioning
- Dampening
- Supporting
- and many more

3 key functions in 1 element

- 35 % women in management positions
- 20 different nations
- Average 10 years of service
- Support of development and internal change

120 competent and motivated employees

- Industry
- Mining
- Food
- Agriculture

4 core markets

- Head office in Switzerland
- 6 subsidiaries
- Over 30 distribution partners in 40 countries

5 continents, over 40 countries

TECHNICAL COMPETENCE

Focus for continuous success

In our efforts to make use of our products in countless processing plants and machinery worldwide in an efficient and safe manner, we provide the world market with our know-how, our experience and with our high quality products.

In addition to standard components, we develop custom-made solutions in cooperation with our customers. With our elements, our customers are able to generate added value by designing their products with fewer components. We furthermore assist our customers and partners with the layout of systems using stress simulations.

Trainings

We are happy to pass on our expertise and many years of experience.

Service

Ensuring the optimum use of ROSTA solutions.

In-house laboratory

High and constant quality is the base of our success.

THE CORE OF OUR PRODUCT

1

DEVELOPMENT

Our development team works closely with our application engineers and customers. We always focus on the customer's needs. New components and services ensure that ROSTA has a competitive advantage.

2

WORKMANSHIP

Production machines, handling equipment, tooling machines and processing systems equipped with state-of-the-art technology can only function perfectly if reliable and motivated employees stand fully behind even the smallest structural components. It is their competence, quality considerations and their great willingness to work that lay the foundations for the production of high quality goods.

3

QUALITY CONTROL

For our customers ISO standards are a guarantee of constant quality and performance. ROSTA is an ISO 9001 and ISO 14001 certified company.
The material tests that take place before and during production are the guarantee for a comprehensive and high quality standard.

4

VARIABILITY

Whether in terms of size, requirement and/or application, our elements from ROSTA are very flexible and customisable, which is why they are used in numerous applications.

RUBBER SUSPENSION ELEMENTS

Torsion-elastic spring assemblies for contemporary engineering and design

- Pendulum suspensions for unbalanced motors
- Torque supports for gear motors
- Torsional springs for continuous surface pressure
- Fully customized rubber suspensions available in exclusive design upon request
- Torsion elastic mounts offering constant pressure on workparts (infeed devices)
- Energy absorbing impact suspensions

Product advantages:

long service life

energy-saving

easy to install

Selection table rubber suspension elements (Rubmix 10)

		Type inner square			
		A Aluminium profile (from size 60 in steel)	C Aluminium profile	S Steel tube for plug-in connection	
		Illustration			Page
Type housing	DR Steel tube	DR-A 	DR-C 	DR-S 	2.4–2.6
	DK Aluminium profile	DK-A 	DK-C 	DK-S 	2.8–2.9
	DW Aluminium profile (from size 60 steel welded construction)	DW-A 15 to 50 	DW-C 15 to 50 	DW-S 15 to 50 	2.11–2.14
		DW-A 60 to 100 			
	DO Aluminium profile	DO-A 	DO-C 	DO-S 	2.15

- DK-C, DO-C and DO-S only on request.
- Note about accessories (BR, BK, WS) on pages 2.7, 2.10, 2.16.
- Aluminium profiles: extruded profiles, seawater resistant (DIN 1725).
- Blue paint: thickness 40–80 µm.
- Inner steel tube type S: electrodeposited galvanic zinc coating.
- Mounting bolts: strength class of 8.8.
- Welding heat will affect or destroy the rubber inserts – ask for customized elements.
- Stainless steel, zinc-plated versions or special paintings upon request.

List of torque and loads

The values stated in the below mentioned list have been measured statically and are valid for the standard rubber quality «Rubmix 10». Intermediate values can be interpolated.

By applications with combined dynamic forces and high angles of oscillation please see chapter 7 «Technology» or contact ROSTA.

Element			Torque						Cardanic	Radial		Axial	
Nominal size	x	Length	M _d [Nm] angle ±α°						M _k [Nm] angle ±β°	Deflection ± s _r [mm]	Load F _r [N]	Deflection ± s _a [mm]	Load F _a [N]

OSCILLATING MOUNTINGS

Elastic suspensions for all types of screening machines, shaker conveyors and gyratory sifters

- Components for all types of vibrating machines and conveyors
- Vibration-damping mountings for circular and linear vibrating screens
- Double rocker arms for high-speed vibrating conveyor troughs
- Spring accumulators for machines in near-resonant operation
- Rocker arms and push rod heads for sliding-crank gutters
- Universal joint bearings for gyratory sifter screening machines
- Spring accumulator for resonance-based operation

Product advantages:

long service life

shatterproof

maintenance-free

Selection tables Oscillating Mountings

						
		One mass system circular motion screen	One mass system linear motion screen	Two mass system with counterframe	One mass system linear motion screen hanging	
		Illustration	Type	Description		Page
Elements for free oscillating systems (with unbalanced excitation)		AB ABI	Oscillating Mounting – universal mounting. High vibration isolation and low residual force transmission. Natural frequencies approx. 2–3 Hz. 9 element sizes from 50 N to 20 000 N.			3.4– 3.5
		AB-HD ABI-HD	Oscillating Mounting for impact loading and high production peaks (Heavy Duty). Natural frequencies approx. 2–4 Hz. 11 element sizes from 150 N to 60 000 N.			3.6– 3.7
		HS HSI			Oscillating Mounting for hanging systems. Natural frequencies approx. 3–5 Hz. 7 element sizes from 150 N to 14 000 N.	3.8
		AB-D		Oscillating Mounting in compact design. Optimal in two mass systems as counter- frame mounting. Natural frequencies approx. 3–4.5 Hz. 7 element sizes from 500 N to 16 000 N.		3.9

					
		Gyratary sifter upright staying	Gyratary sifter hanging		
		Illustration	Type	Description	Page
Elements for gyratary sifters		AK	Universal joint for the support or suspension of positive drive or freely oscillating gyratary sifting machines. 10 element sizes up to 40 000 N per AK.		3.19
		AV	Single joint specially designed with a large rubber volume for the suspended gyratary sifters. Models with right-hand and left-hand threads. 5 element sizes up to 16 000 N per AV.		3.20

		
One mass system «brute-force» system	One mass system «natural frequency» system	Two mass system «fast-runner» system with reaction force compensation

Elements for guided systems (crank driven)	Illustration	Type	Description	Page	
		AU AUI	Single Rocker for a variable arm length. Models with right-hand and left-hand threads. 7 element sizes up to 5 000 N.		3.10
		AS-P AS-C	Single rocker with standardized center distance. 6 sizes up to 2 500 N for flange fixation. 6 element sizes up to 2 500 N for central fixation.		3.11 – 3.12
		AD-P AD-C		Double rocker with standardized center distance. 5 element sizes up to 2 500 N for flange fixation. 4 element sizes up to 1 600 N for central fixation.	3.13 – 3.14
		AR	Single rocker and double rocker with adjustable length, connection of the AR elements using round pipe. Two mass shakers with bi-direction flow are simply to realize. 3 element sizes up to 1 600 N.		3.15
		ST STI	Drive Head for crank drive transmission. Models with right-hand and left-hand threads. 9 element sizes up to 27 000 N.		3.16 – 3.17
		DO-A		Spring accumulator with high dynamic spring value for feeder systems running close to resonance frequency. A spring accumulator consists of 2 DO-A elements. 5 element sizes up to dynamic spring value of 320 N/mm.	3.18

* compression load $G_{max.}$ and cold flow compensation (after approx. 1 year).

If no other units are specified, the numbers given are in mm.

Dynamic spring value: Values in nominal load range at 960 min⁻¹ and 8 mm of oscillating stroke sw

Operating parameters by rpm: Acceleration > 9.3g is not recommended

Material structure: AB50 and AB50-2 available with nodular cast iron housings on request

If no other units are specified, the numbers given are in mm.

c_s = dynamic spring value of the complete accumulator by oscillating angle of $\pm 5^\circ$ and revolutions n_s between $300 - 600 \text{ min}^{-1}$.

1 spring accumulator is always consisting of 2 pcs. DO-A elements, for further information see chapter 7 Technology.

Material structure: DO-A 50 available with nodular cast iron housings on request.

If no other units are specified, the numbers given are in mm.

G = max. load in N per support column

Usual drive parameters from experience: Driving speed n_s up to approx. 380 min^{-1} , Oscillation angle α up to approx. $\pm 3.5^\circ$.

Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.

For further information see chapter 7 Technology.

G = max. load in N per suspension

Elements for higher load on request

Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.

The threaded connection rod has to be provided by the customer.

VIBRATION DAMPERS

Highly elastic and tearproof mounts for passive and active vibration dampening

- Vibration-free mounting of motor test stands, emergency generators, compressors, etc.
- Tearproof mounting of suspended loads such as crane tracks and cable car cabins
- Anti-vibration machine leveling feet with balancing ball joints
- Impact-resistant vibration dampers for energy dissipation at belt transfer stations
- Standardised product range for high load capacities

Product advantages:

high degree
of isolation

tearproof

maintenance-free

Selection table vibration dampers

	Illustration	Type	Description	Page
Vibration dampers basic types		ESL	Vibration dampers for the absorption of tensile, pressure and shear load. Also ideal for wall and ceiling installations. 8 element sizes from 200 N to 19 000 N. Natural frequency between 3.5–8 Hz. Mounts are mainly used for overcritical machine installations (machine frequency > mount frequency).	4.3
		AWI	Vibration dampers for to absorb tensile and pressure loads. 7 element sizes from 180 N to 16 000 N. Natural frequency between 3–7 Hz. Mounts are mainly used for overcritical machine installations (machine frequency > mount frequency).	4.4
		V	Vibration dampers for the absorption of tensile, pressure and shear load. Also ideal for wall and ceiling installations. 6 element sizes from 300 N to 12 000 N. Natural frequency between 10–30 Hz. Mounts can be used for subcritical machine installations (machine frequency < mount frequency).	4.5
Vibration dampers additional types		N	Mounting feet consisting of insulating plate, top cover with built-in levelling jack-screw with spherical joint for compensation of up to 10° of floor unevenness. Insulating plate oil- and acid-proof. FDA approved. 3 element sizes from 3 500 N to 20 000 N. Natural frequency between 19–27 Hz.	4.6
		NOX	Mounting feet consisting of insulating plate, stainless steel top cover with built-in stainless levelling jackscrew with spherical joint to compensate of up to 10° of floor unevenness. Insulating plate oil- and acid-proof. FDA approved. 2 element sizes from 5 000 N to 20 000 N. Natural frequency between 19–24 Hz.	
		Base plate P	Accessories for N and NOX for high shear forces or for assembling on a base or frame. The base plate must be bolted to the floor.	4.7
		M	Mounting feet consisting of metallic insulating cushion. Cushion resistant against corrosion, greases and solvents. 6 element sizes from 300 N to 35 000 N. Natural frequency between 14–26 Hz.	4.8
		NE	Adhesive cushioning plates made of closed-cell polyether urethane, no water absorption and good oil resistance. 3 element sizes from 500 N to 130 000 N. Natural frequency between 14–25 Hz.	4.9

* compression load $G_{max.}$ and cold flow compensation (after approx. 1 year).

If no other units are specified, the numbers given are in mm.

The sizes 50 to 50-2 can be combined with one another (identical heights and operation behaviour).

The max. load on X-axis should not exceed 200% of the Z-axis capacity.

The max. load on Y-axis should not exceed 20% of the Z-axis capacity.

Applicable on tensile, pressure and shear load.

If no other units are specified, the numbers given are in mm.

Insulates structure-borne noise.

Chrome-steel cushion temperature resistant -40°C to $+250^{\circ}\text{C}$.

Resistant against corrosion, greases and solvents.

Up to 3 g dynamic shock loading permissible.

Unlimited lifetime.

On request available stainless steel anti-slip soles with granules on the underside:

– Part no. 04 020 451 for M 43 M16 and M 43W M16

– Part no. 04 020 452 for M 44 M16 and M 44W M16

– Part no. 04 020 453 for M 45 M20 and M 45W M20

Tolerances according to ISO3302-1:1999 class L3 and EC3. The deflection of the cushions by the mentioned max. catalogue load capacities is 1.4 mm.

TENSIONER DEVICES

Optimum tension for chain and belt drives

- Quiet and smooth running
- Best possible transfer of power
- Automatic re-tensioning
- Compensation for belt elongation
- Pressing, guiding and vibration damping

Product advantages:

wide range
of applications

energy-saving

minimal
maintenance costs

Selection table tensioner devices

Standard tensioner devices		SE	Standard component. Housing and inner part made out of steel. Rubber quality Rubmix 10. Steel parts ROSTA blue painted. Working temperature: – 40 ° to + 80 °C.	5.3
		SE-G	Oil resistant. Housing and inner part made out of steel. Rubber quality Rubmix 20. Steel parts galvanized. Marked with yellow dot or printing R20. Working temperature: – 30 ° to + 90 °C.	
		SE-W	Heat resistant. Housing and inner part made out of steel. Rubber quality Rubmix 40. Steel parts ROSTA blue painted. Marked with red dot or printing R40. Tension force 40% less than SE. Working temperature: – 35 ° to + 120 °C.	
Additional tensioner devices		SE-R	Reinforced lever arm. Housing and inner part made out of steel. Rubber quality Rubmix 10. Arm and inner core especially welded for use on combustion engines and compressors. Steel parts ROSTA blue painted. Marked with white ring or printing SE-R. Working temperature: – 40 ° to + 80 °C.	5.3
		SE-I	Housing and inner part made out of stainless steel. Rubber quality Rubmix 10. For the use in food- and pharmaceutical industries. Material: GX5CrNi19-10. Working temperature: – 40 ° to + 80 °C.	5.4
		SE-B	Boomerang®. Housing and inner part made out of steel. Rubber quality Rubmix 10. For the tensioning of very long chain and belt drives (triple compensation). Steel parts ROSTA blue painted. Working temperature: – 40 ° to + 80 °C.	5.5
		SE-F	Front mounting device. Housing and inner part made out of steel. Rubber quality Rubmix 10. As example for installations on blind-hole frames (fixation from the front only). Steel parts ROSTA blue painted. Hex socket screw quality 12.9. Working temperature: – 40 ° to + 80 °C.	5.6
		SE-FE	Front mounting. For installations on blind-hole frames (fixation from the front only). Steel parts painted black. Hex socket screw quality 12.9. Especially designed for engine applications. Working temperature: see page 5.7.	5.7

Note about accessories on pages 5.8–5.17.

The ROSTA Motorbases MB 50 are supplied with the motor plate installed in «off-set» configuration. Depending on the operating angle of the running belts, the motor plate can also be configured «centrally» over the element axis. Corresponding threads are present on the motor plate. For a higher setting angle of the motor plate, the lever can be mounted at 45°.

The Motorbases have galvanized surfaces, the blue painted ROSTA rubber suspension element as well as several labels with information for adjustment procedures, product name and traceability. A QR code stands for getting additional product information.

If no other units are specified, the numbers given are in mm.

Please follow our instructions at www.rosta.com

The MB75 features a single, centred pre-tensioning device for easy handling (like the MB100). The hole pattern of the motor plate is equal to the pattern of the baseplate. This enables a previously fix installed motor onto a MB75 without extra efforts. Furthermore, the side plates of the MB75 incorporate extra openings for easier handling during installation.

All three sizes of the MB75 have a 100 mm offset position of the motor plate, a compact height of 315 mm, galvanized surfaces, the blue painted ROSTA rubber suspension element as well as several labels with information for adjustment procedures, product name and traceability. A QR code stands for getting additional product information.

If no other units are specified, the numbers given are in mm.

Please follow our instructions at www.rosta.com

TECHNOLOGY

A unique spring system from experienced specialists

We at ROSTA have experienced the needs and solved the problems of our customers for more than 75 years. Together with our customers, we analyse their applications and concerns based on decades of experience. We help them to optimise their products and plants and improve their process safety. The result is higher productivity and a true competitive advantage.

Who doesn't want that?

ROSTA Basics

Function

The ROSTA rubber suspension elements are mainly designed for applications as torsional spring devices offering operation angles of $\pm 30^\circ$. Depending on the particular function, not only torsional moments are generated by pivoting the spring device. According to the specific application additional radial F_r , axial F_a and / or cardanic M_k forces have usually to be taken in consideration. The occurring torques of the different elements and the additional load characteristics are indicated in the respective chapter.

Spring characteristic

Due to the specific construction characteristics of the ROSTA rubber suspension element, pivoting the device \pm results in a slightly progressive spring characteristic. The torsion angle is limited to ± 30 for most elements.

ROSTA Basics

Damping

The occurring hysteresis in the ROSTA element is added to the resulting energy loss work in the rubber inserts during the pivoting activity of the spring device. In the process of the element actuation a part of the resulting energy is transformed into frictional work generating heat. The shaded surface between load and relieve headline indicates the effective energy loss. At element actuation out of the zero position up to 30°, the resulting average energy loss is at 15 to 20%. At the actuation of a pre-tensioned element, the resulting ± working angle is usually only a few degrees, therefore the energy loss reduces within a limit (see graph).

Uniquely animated element oscillations fade within short term, due to the occurring energy loss at each following post-pulse oscillation. (Very important at the use of ROSTA screen mountings – during the operation procedure of the screen the resulting power loss in the ROSTA mountings is neglectable; during the running down phase, close to the resonance frequency of the suspensions, an important amplitude exaggeration occurs. The high energy loss in the ROSTA screen mountings dampens and absorbs these exaggerations within only a few post-pulse oscillations.)

Natural frequency

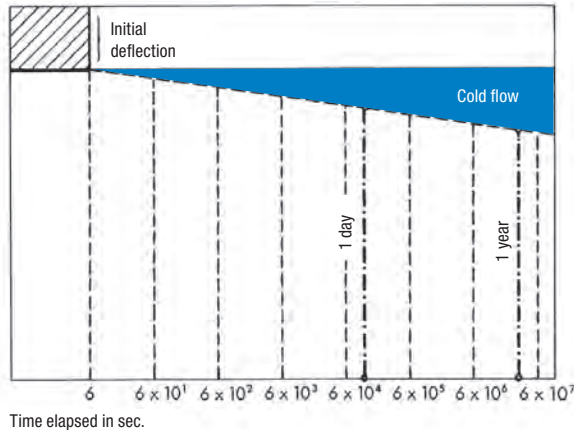

The determination of the natural frequency of a ROSTA suspension has to be carried out by spreading the tangent at the loading point «A» on the parabolic arc of the load deflection curve. The resulting distance s₁ on the axis of abscissa comes up to the arithmetical spring deflection in mm, required for the determination of the natural frequency.

$$\text{Natural frequency } n_e = \frac{300}{\sqrt{s_1 \text{ (in cm)}}} = \text{min}^{-1}$$

$$\text{or } f_e = \frac{5}{\sqrt{s_1 \text{ (in cm)}}} = \text{Hz}$$

Cold flow and settling of the rubber suspensions

All elastic materials show more or less permanent measurable deformation over time when subjected to a load. This is noticeable in a relatively small additional deflection, the cold flow. This cold flow runs over a linear logarithmic time scale. The illustration shows that after being under a load for one day, already compensates for more than half of the flow deformation of a year; after one year of use, the overall element settling is largely compensated (depending on the temperature and frequency). Empirical findings show that the settling factor lies within a 3° to 5° loss of the element to the neutral 0° position, with combined vibrating bearings at approx. +10% of the respective nominal deflection according to the catalogue specification.

Temperature influence

The ROSTA rubber suspension elements are designed in the standard rubber quality «Rubmix 10» for use in the temperature range of -40°C to $+80^{\circ}\text{C}$. As the temperature rises, the mechanical torque strength decreases. This decrease is at a low approx. 5% in the upper temperature range ($+80^{\circ}\text{C}$). At lower ambient temperatures, i.e. in the minus range, the mechanical torsional stiffness increases (at -40°C up to 15%). The internal damping of the elements undergoes a similar process: when the temperature drops, the damping percentage increases and then falls again when the temperature rises. Due to the internal friction (energy loss work), the rubber inserts in the suspension elements warm up with every movement, meaning the effective element temperature may vary in relation to the ambient temperature.

Service life

Provided the rubber suspension elements are selected according to the technical specifications, i.e. are operating within the given frequencies and oscillation angles and under the mentioned surrounding conditions, no loss of performance and functionality can be expected for many years. Extremely low or high permanent surrounding temperatures considerably shorten the lifetime expectancy of the rubber suspension elements. The opposite service life curve indicates the relevant life deduction at extreme \pm temperatures from factor 1 at room temperature of $+22^{\circ}\text{C}$.

ROSTA Basics

Quality control and tolerances

Since December 1992 ROSTA AG has been an ISO 9001 standard certified development, manufacture and distribution company. All products undergo regular functional and quality testing. The rubber inserts are continuously tested and controlled on the test machines of the in-house laboratory with regard to Shore A hardness, compression set, abrasive wear, rebound resilience, tensile strength, breaking elongation and aging behaviour. The dimensional tolerance of the rubber inserts is defined according DIN 7715 standard and the Shore A hardness according to DIN 53505 standard. The inner-core profiles and housings of the rubber suspension elements are subject to the tolerance guidelines of the relevant production process and respective supplier (e.g.

cast, extruded, edge rolled) and the individual material consistence (e.g. aluminium casting, steel tube, nodular cast iron part, etc.). The resulting torsional moments and spring deflections of the ROSTA rubber suspension elements are within a tolerance range of $\pm 15\%$ at the most, but usually lie in a much narrower range!

Permissible frequencies

Alignment chart for determining the permissible frequencies and oscillation angles in relation to the respective rubber suspension element type (DR 11, 15, 18, etc.). The higher the frequency in min^{-1} , the lower the oscillation angle should be and vice versa.

Example: (see blue indication on chart) A rubber suspension of type DR 50 may be rotated from the neutral position (0°) to an oscillation angle of $\pm 6^\circ$ by a max. frequency of 340 min^{-1} . For applications of «pre-tensioned» elements working, e.g. under 15° of pre-tension and describing oscillation angles of $\pm 5^\circ$ at 250 min^{-1} , it is absolutely necessary to consult ROSTA.

ROSTA Basics

Rubber qualities

The majority of all ROSTA rubber suspension elements are equipped with the standard quality «Rubmix 10» rubber inserts. This rubber quality is based on a high content of natural rubber, offers good shape memory, low settling factors (cold flow), high mechanical strength and moderate aging behaviour (little embrittlement/hardening of the rubber inserts).

Where high oil consistency, heat resistance or even greater torques are required, other resilient inserts with the corresponding characteristics can be installed in the rubber suspension elements.

Special qualities on request.

Rubber quality	Factor in relation to the list «torque and loads» (chapter 2 rubber suspension elements)	Working temperature	Material	Comments
Rubmix 10	1.0	-40° to +80°C	NR	- Standard quality - Highest elasticity - Lowest cold flow
Rubmix 20	approx. 1.0	-30° to +90°C	CR	- Good oil-resistance - Elements marked with yellow dot or R20
Rubmix 40	approx. 0.6	-35° to +120°C	EPDM-Silicone	- High temperature resistance - Elements marked with red dot or R40
Rubmix 50	approx. 3.0	-35° to +90°C	PUR	- Max. oscillation angle ±20° - Limited oscillation frequencies - No permanent water contact - Elements marked with green dot or R50

Chemical resistance

The standardised ROSTA rubber suspension elements are equipped with «Rubmix 10» elastic inserts. These have a high chemical resistance compared to many media. For specific applications, however, the elements must be provided with additional protection or synthetically constructed elastomer inserts should be used («Rubmix 20», «Rubmix 40» or «Rubmix 50»), which will slightly change the characteristics compared to the standard quality (see Rubber qualities).

The resistance table below is only a guideline and is incomplete. In practical use, data for the concentration of the respective medium and the operating temperature are required to determine the resistance. Please contact us in this regard.

Rubmix	10	20	40	50

RUBBER SUSPENSION ELEMENTS

Rubber suspension elements

Description of inner squares

A
Suitable for alternating deflection via the element rest position. Nominal sizes 15 to 45: Fastening with 2 to 4 continuous screws (of which nominal sizes 27 to 45 with threads are available).

C
Attachment with central screw for frictional connection with 360° adjustment. For optimum frictional connection, please remove the paint on the front side. Alternating deflection up to max. $\pm 10^\circ$.

S
For plug-in connections, select plug-in length at least $2 \times$ light dimension «C». The inserted square must be blank, with a tolerance of h9 to h11. The corners may be over-rotating, the inner radius is max. 1.5 mm). Up to nominal size 18, a frictional connection can be made with one screw. No reciprocal deflection over the element zero position.

Serial and parallel connection

Serial connection

Double oscillating angle ($\pm 60^\circ$) with a constant torque.

Parallel connection

Double torque at constant oscillating angle ($\pm 30^\circ$).

Rubber suspension elements

Examples of fixations

Housing

Outer tube with bracket BR

Plug-in connection

Round housing with bracket BK

Outer housing in clamping jaw

Inner Square Section

Plug-in connections: inner square made of tubular steel, lever arm with welded-on square profile

Inner square section with a central through bore

Inner square with through holes and bolted-on lever arm

Inner square with through holes and brackets WS

Rubber suspension elements

Application examples

Pressure rollers in saw device

Conveyor-belt scraper

Independent wheel suspension

Elastic scraper / brushing joint

Self-aligning bearing for cleaning brushes

Passive insulation

Shock absorber

Control unit insulation

Impact suspension in feeder

OSCILLATING MOUNTINGS

Oscillating mountings – free oscillating systems

Calculation bases

Subject	Symbol	Unit
Mass of the empty channel and drive *	m_0	kg
Products on the channel *	m_m	kg
Total vibrating mass	$m = m_0 + m_m$	kg
Mass distribution: feed end	% feed end	%
discharge end	% discharge end	%
Acceleration due to gravity	g	9.81 m/s ²
Load per corner feed end	F feed end	N
Load per corner discharge end	F discharge end	N
Working torque of both drives	AM	kgcm
Oscillating stroke empty channel	sw_0	mm
Oscillating stroke in operation	sw	mm
Motor revolutions	n_s	min ⁻¹
Centrifugal force of both drives	Fz	N
Oscillating machine factor	K	
Machine acceleration	$a = K \cdot g$	g

Calculation formulas

Loading per corner

$$F_{\text{feed end}} = \frac{m \cdot g \cdot \% \text{ feed end}}{2 \cdot 100} \quad F_{\text{discharge end}} = \frac{m \cdot g \cdot \% \text{ discharge end}}{2 \cdot 100} \quad [N]$$

Oscillating stroke

$$sw_0 = \frac{AM}{m_0} \cdot 10 \quad sw = \frac{AM}{m} \cdot 10 \quad [mm]$$

Centrifugal force

$$F_z = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot AM \cdot 10}{2 \cdot 1000} = \frac{n_s^2 \cdot AM}{18'240} \quad [N]$$

Oscillating machine factor

$$K = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot sw}{2 \cdot g \cdot 1000} = \frac{n_s^2 \cdot sw}{1'789'000} \quad [-]$$

* When determining the weight, take into account:

- High coupling or sticking of humid bulk material
- Channel running full
- Fully stacked screen deck with humid material
- Weight distribution with and without conveyed material
- Centrifugal force does not run through the center of gravity (channel full or empty)
- Sudden impact loading occurs
- Subsequent additions to the screen structure (e. g. additional screening deck)

Oscillating mountings – free oscillating systems

Vibration isolation

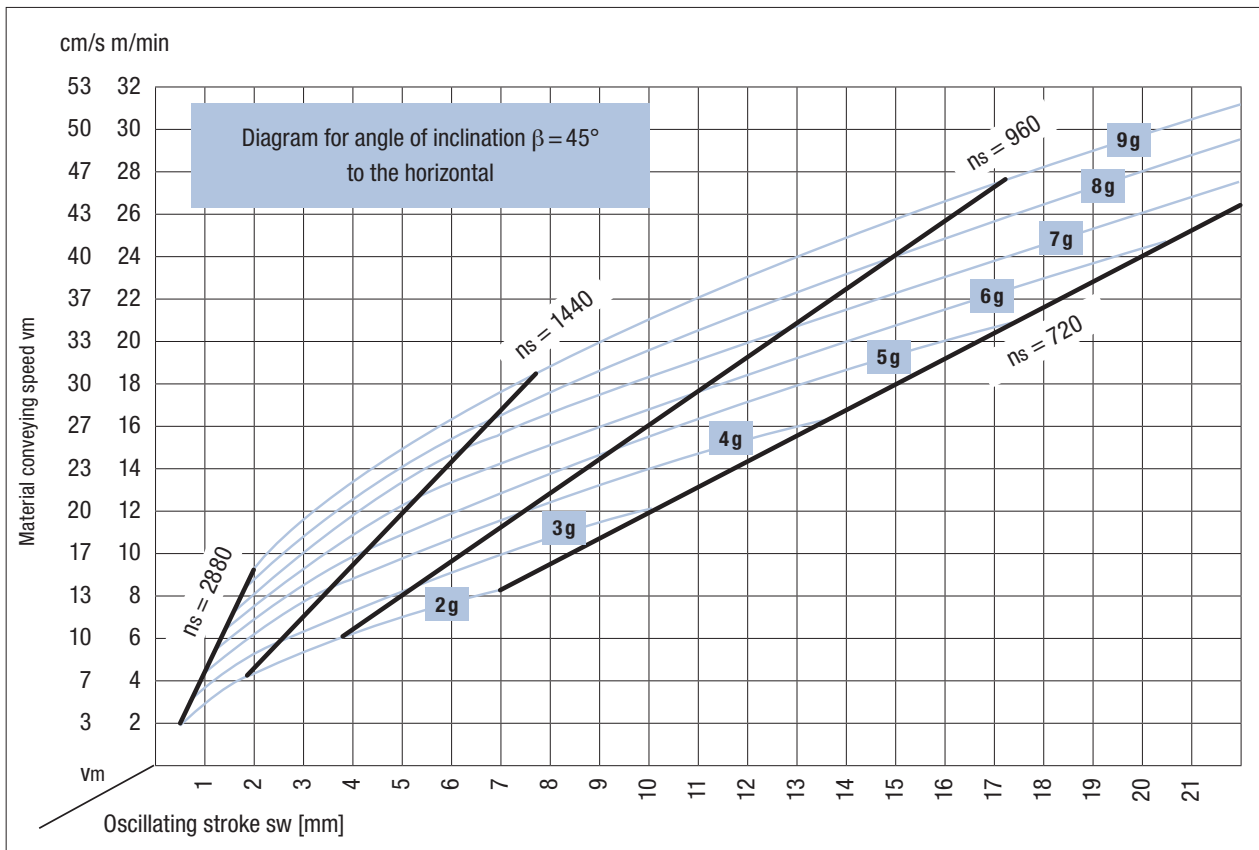

Calculation formula

$$W = 100 - \frac{100}{\left(\frac{n_s}{60 \cdot fe}\right)^2 - 1} \quad [\%]$$

Oscillating mountings – free oscillating systems

Average material conveying speed v_m

Main influencing factors

- Conveying ability of the material
- Height of the bulk goods
- Inclination of screen base
- Drive angle of the exciters in linear oscillators
- Position of the centre of gravity

The material speed on circular motion screens varies and depends largely on the tilt of the screen box.

Oscillating mountings – free oscillating systems

Operating and resonance behaviour

Laboratory measurements of a typical development of the residual forces on a ROSTA screen suspension.

At the screen start-up and run-out, the element's natural frequency is passed through. During the resulting amplitude superelevation, the four rubber suspension elements generate a high level of damping, which greatly reduces the vibration amplitudes. The screen box therefore stops fully after only a few strokes.

The rocker arm fixed to the screen carries out the greater part of the oscillations. The rocker arm fixed to the substructure remains virtually stationary, provides a strong cushion and ensures a low natural frequency and therefore a good insulation on the base frame.

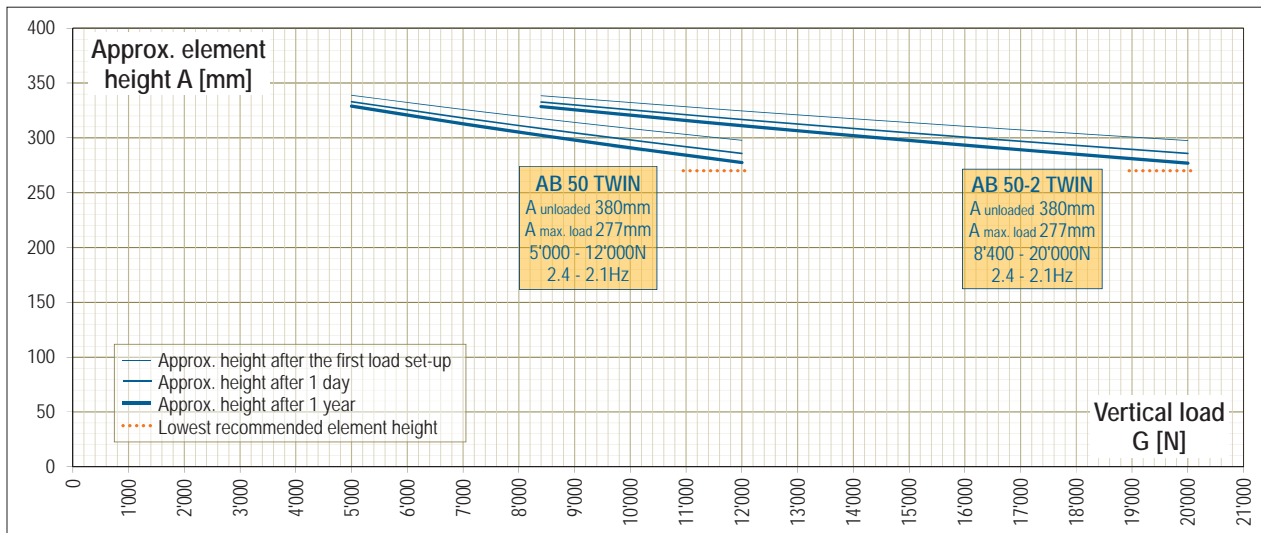

Alignment of the elements

The mounting axis has to be arranged at a right angles (90°) to the conveying axis, with maximum tolerance of $\pm 1^\circ$.

Oscillating mountings – free oscillating systems

Element heights and setting behaviour AB and ABI

Oscillating mountings – free oscillating systems

Element heights and setting behaviour AB-HD and ABI-HD

Oscillating mountings – guided systems

One mass systems without spring accumulators: calculation

	Subject	Symbol	Unit
Length, weight	Weight empty trough *	m_0	kg
	Weight of feeding material *		kg
	Weight of oscillating mass	$m = m_0 + m_m$	kg
Drive parameter	Eccentric radius	R	mm
	Stroke	$sw = 2 \cdot R$	mm
	Rpm on trough	n_s	min ⁻¹
	Gravity acceleration	g	9.81 m/s ²
	Oscillating machine factor	K	
	Acceleration	$a = K \cdot g$	m/s ²
	Total spring value of system	c_t	N/mm
Rocker arms	Quantity of rockers **	Z	
	Load per rocker	G	N
	Center distance of elements	A	mm
Drive	Acceleration force	F	N
	Drive capacity approx.	P	kW
Spring value of natural frequency shaker	Dynamic torque	Md_d	Nm/°
	Dynamic spring value per rocker	c_d	N/mm
	Dynamic spring value of all rockers	$Z \cdot c_d$	N/mm
	Resonant ability factor	i	

- * When determining the weight, take into account:
- High coupling factor or sticking of wet and humid material
 - Possible stemming of the trough

** Distance of the rocker max. 1.5 metres.

Calculation formulas

Oscillating machine factor

$$K = \frac{\left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot R}{g \cdot 1000} = \frac{n_s^2 \cdot R}{894'500} [-]$$

Total spring value of system

$$c_t = m \cdot \left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot 0.001 \quad [\text{N/mm}]$$

Load per rocker

$$G = \frac{m \cdot g}{Z} \quad [\text{N}]$$

Acceleration force (for ST selection)

$$F = m \cdot R \cdot \left(\frac{2\pi}{60} \cdot n_s\right)^2 \cdot 0.001 = c_t \cdot R \quad [\text{N}]$$

Drive capacity approx.

$$P = \frac{F \cdot R \cdot n_s}{9550 \cdot 1000 \cdot \sqrt{2}} \quad [\text{kW}]$$

Dynamic spring value per rocker

$$c_d = \frac{Md_d \cdot 360 \cdot 1000}{A^2 \cdot \pi} \quad [\text{N/mm}]$$

Resonant ability factor

$$i = \frac{Z \cdot c_d}{c_t} [-]$$

By a resonant ability factor $i \geq 0,8$ the system is usually titled «natural frequency shaker».

Oscillating mountings – guided systems

One mass system with spring accumulators: calculation

Calculation analog one mass systems without spring accumulators with following additions:

Subject	Symbol	Unit
Spring accumulators	Quantity	Z_s
	Dynamic spring value per item	C_s N/mm
	Dynamic spring value of all items	$Z_s \cdot C_s$ N/mm
	Resonant ability factor	i_s

Calculation formulas

Resonant ability factor with accumulators

$$i_s = \frac{Z \cdot C_d + Z_s \cdot C_s}{C_t} [-]$$

By a resonant ability factor is ≥ 0.8 the system is usually titled «natural frequency shaker».

One mass conveyor system: installation instructions

Distance between rockers L_{max} :

- Usually, the distance between the rockers in the longitudinal direction must not exceed 1.5 metres.
- With chutes wider than 1.5 m, we recommend fitting a third row or multiple rows of rockers on the underside of the chute base or to install spring accumulators to improve the stability.

Mounting position drive head ST:

For one mass shaker systems it is recommendable to position the drive head slightly ahead of the center of gravity of the trough, towards the discharge end.

Angle of attack β :

The angle of attack β of the rocker must be between 10° and 30° to the perpendicular line, depending on the process and the conveying speed. (The optimum combination of a fast conveying speed and the high material throw is given at the angle of attack $\beta = 30^\circ$.) The operating direction of the drive rod should be at 90° , i.e. the thrust angle of attack β is accordingly between 10° and 30° to the horizontal line.

Oscillation angle α :

The parameters for the oscillation angle and speed must be within the permissible range, see «permissible frequencies» in chapter 7 Technology.

Screw grade:

Select screw grade 8.8 and mount with correct tightening torque.

Thread length Z:

The thread length Z is at least $1.5 \times$ the nominal thread size.

Oscillating mountings – guided systems

Two mass system with direct mass balance

- Max. acceleration of approx. 5 g and max. chute length of approx. 25 metres
- Double rockers made from ROSTA elements AR, AD-P or AD-C
- Optimal balance of forces with $m_1 = m_2$
- Calculation same as for one mass system, with the following difference:

Actuated mass incl. material coupling	m_1 [kg]
Driven mass incl. material coupling	m_2 [kg]
Total oscillating mass	$m = m_1 + m_2$ [kg]

Dynamic spring value per rocker
[N/mm]

$$c_d = \frac{3 \cdot Md_g \cdot 360 \cdot 1000}{2 \cdot A^2 \cdot \pi} \quad [\text{N/mm}]$$

- Calculation of c_t and F with the new total oscillating mass m
- Introduction of force with the ST at any point along the chute, 90° to the rocker axis
- For customised rockers with different centre distances A , please contact ROSTA

Oscillating mountings – guided systems

Average material conveying speed v_m

Main influence factors:

- bulk height
- sieve surface texture
- drive angle and thus rocker angle of attack
- feeding capacity is dependent on shape and humidity of the material, e.g. dry, fine-grained material needs correction factors up to 30%.

By acceleration factors $K > 2$ and rocker mounting angles of $\beta = 30^\circ$ (to the perpendicular line) the vertical acceleration is getting bigger than 1g, therefore the material starts lifting from the trough bottom = material throw.

Oscillating mountings – guided systems

Maximum load G, speed n_s and oscillation angle α

Size (e. g. AU 15)	max. load capacity per rocker [N]				max. revolutions n_s [min ⁻¹]*	
	K < 2	K = 2	K = 3	K = 4	$\alpha \pm 5^\circ$	$\alpha \pm 6^\circ$
15	100	75	60	50	640	480
18	200	150	120	100	600	450
27	400	300	240	200	560	420
38	800	600	500	400	530	390
45	1600	1200	1000	800	500	360
50	2500	1800	1500	1200	470	340
60	5000	3600	3000	2400	440	320

Please contact ROSTA for higher machine parameters and elements with greater loads.
The revolutions are usually $n_s = 300$ to 600 min^{-1} and oscillation angle α to max. $\pm 6^\circ$.
*see «permissible frequencies» in chapter 7 Technology.

The oscillation angle α of each component must be within the permissible range of application (n_s and α), i.e. rockers, drive rods and spring accumulator.

Calculating the oscillation angle for rockers

Eccentric radius R [mm]

Center distance A [mm]

Oscillation angle $\alpha \pm [^\circ]$

$$\alpha = \arctan\left(\frac{R}{A}\right) [^\circ]$$

AU / AU1: Connection rod

The customer manufactures the connection rod, preferably with a left and right-hand thread. Together with the corresponding oscillating mountings, the distance between the mountings (A) can be freely adjusted. Using a standard threaded rod (with «only» a right-hand thread) may be more economical, but it is less accurate.

The centre distance A must be set identically for all rockers and the thread length Z must be at least $1.5 \times M$.

AS / AD: Resulting oscillation angle α from eccentric radius R

Single rocker AS

Double rocker AD

Oscillating mountings – guided systems

AR: Single, double and two-way Rocker

Single rocker

The two AR elements are pushed onto a round tube. The desired center distance is set on a straightening plate and then fixed by tightening the clamp.

Double rocker

With three AR elements, the tube wall thickness is adjusted to the centre distances A, see «dimensioning of the connecting tubes». The counterweight can be used as an additional conveyor trough with the same conveying direction.

Two-way rocker

The three AR elements mounted in the boomerang configuration create a two-way material flow. Tube wall thickness according to «dimensioning of the connecting tubes». This two-way conveying flow can simplify the conveying process and the mass balance is maintained with this arrangement.

AR: Dimensioning of the connecting tubes

For double rockers and two-way rocker

Type	Tube- ϕ	thickness of tube	max. centre distance A	resulting min. angle of attack β [°] with two-way rocker
AR 27	30	3	160	26.0
		4	220	19.5
		5	300	14.6
AR 38	40	3	200	27.5
		4	250	22.6
		5	300	19.1
AR 45	50	5	300	23.4
		8	400	18.0

The customer provides the connecting tubes.

For single rockers with AR 27 or AR 38, it is sufficient for the tubes to have a wall thickness of 3 mm up to A = 300 mm.

For different centre distances A, please contact ROSTA.

Oscillating mountings – guided systems

ST/STI: Length of drive rod A_{ST} and eccentric radius R

To introduce the force in balance, the deflection angle α_{ST} of the drive rod must not exceed $\pm 5.7^\circ$. This corresponds to a ratio $R:A_{ST}$ of 1:10.

Calculation deflection angle

Eccentric radius R [mm]

Center distance A_{ST} [mm]

Deflection angle $\alpha_{ST} \pm [^\circ]$

$$\alpha_{ST} = \arcsin \left(\frac{R}{A_{ST}} \right) [^\circ]$$

DO-A: Operating parameters and installation guidelines

Example deflection angle DO-A (series connection)	Accumulator cons. of 2 x DO-A 45				Accumulator cons. of 2 x DO-A 50			
	R	sw	max. n_s	max. K	R	sw	max. n_s	max. K
$\pm 6^\circ$	15.3	30.6	360	2.2	16.4	32.8	340	2.1
$\pm 5^\circ$	12.8	25.6	500	3.6	13.6	27.2	470	3.4
$\pm 4^\circ$	10.2	20.4	740	6.2	10.9	21.8	700	6

The connecting levers made by the customer, between the DO-A elements, are at 90° to the DO-A element axis. A cross bracing can be installed (V) if required. The DO-A elements are parallel to each other and parallel to the rockers; they are attached by means of a fork construction at a rigid point on the vibrating conveyor and base frame.

Oscillating mountings – gyratory sifters

AK: Installation guidelines for gyratory sifters

1. Arrange the two inner elements offset by 90° (even torsional load).
2. Connect the AK, adjust the installation height. Even when the sifters are at an angle, the column height «X» must be identical.
3. Angle supports type WS can be used up to AK 50 (see chapter 2 rubber suspension elements).
4. To avoid unwanted tilting and turning, the screen box's centre of gravity «S» is positioned on or within the universal joint column.

Hanging and freely oscillating gyratory sifter

Standing gyratory sifter with positive crank shaft drive

AK: Calculation for gyratory sifters

Machine type: standing gyratory sifter with positive crank drive

Description	Symbol	Unit	Calculation formula
Total oscillating mass (material included)	m	kg	Oscillation angle $\alpha = \arctan\left(\frac{R}{X}\right) [^\circ]$
Eccentric radius	R	mm	
Length of support column	X	mm	
Oscillation angle (out of R and X)	$\alpha \pm$	°	Load per column $G = \frac{m \cdot g}{z} [N]$
Quantity of support columns	z	pcs.	
Load per column	G	N	

Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.

Oscillating mountings – gyratory sifters

AV: Installation guidelines for gyratory sifters

1. With the right-hand and left-hand threaded versions, the length X of the suspension rod can easily be adjusted. X has to be identical for all columns and the specified angle limitations must be respected!
2. Installing the two elements in a crosswise configuration moves the gyratory sifter in a circular motion.
3. Installing the two elements in the same configuration moves the gyratory sifter in an elliptical motion.
4. To avoid unwanted tilting or turning, the centre of gravity of the screen box «S» is positioned at the same level or slightly below the suspension rod's attachment.
5. Please consult ROSTA in the selection of AV elements for standing gyratory sifters.

② circular oscillation

③ elliptical oscillation

AV: Calculation for gyratory sifters

Description	Symbol	Unit	Calculation formula
Total oscillating mass (material included)	m	kg	Oscillation angle
Eccentric radius ②	R	mm	
Length of suspension rod	X	mm	$\beta = \arctan\left(\frac{R}{X}\right) [^\circ]$
Oscillation angle (out of R and X), shall not exceed $\pm 2^\circ$ ②	$\beta \pm$	°	Load per suspension rod
Quantity of suspension rods	Z	pcs.	
Load per suspension rod	G	N	

$$G = \frac{m \cdot g}{z} [N]$$

Limitation of application parameters see «permissible frequencies» in chapter 7 Technology.

VIBRATION DAMPERS

Vibration dampers

Isolation of oscillations and shocks

Manufacturers of vibration dampers usually offer different designs of machine mounts with varying natural frequencies, to meet the required detuning between the excitation frequency of the machine to be mounted and the natural frequency of the damper.

The vibration technology basically differentiates between two different oscillation patterns. Oscillations are usually eradicated with supercritical designed machine mounts, while shocks are eradicated with subcritical ones.

Frequency proportion λ

- $\lambda > \sqrt{2}$: Overcritical: vibration isolation, definable effectiveness W , and efficient structure-borne sound insulation
- $\lambda = 1$: Resonance range: amplified resonance, maximum values depend on the internal insulation D within the resonance range
- $\lambda < 1$: Subcritical: no definable vibration isolation and lower structure-borne sound insulation

Vibration dampers

Overcritical installations ($\lambda > \sqrt{2}$)

For overcritical mounts, the natural frequency values of the mounts must be at least $\sqrt{2}$ below the excitation frequencies of the machine or unit. As a rule, a damper with a relatively large spring deflection performance under load is selected. Most units, compressors, motors, blowers and generators are mounted overcritical making them relatively «soft». The resulting frequency ratio provides information about the expected isolation effectiveness of the mount. The line scale opposite and the calculation give the expected insulation W as a %.

$$W = 100 - \frac{100}{\left(\frac{n_s}{60 \cdot f_e}\right)^2 - 1} [\%]$$

n_s =
Revolution exciter
(machine) [rpm]

f_e =
Natural frequency damper
[Hz]

Subcritical installations ($\lambda < 1$) and resonance range ($\lambda = 1$)

Subcritical installations

A damper with high mechanical strength and low deflection behaviour (high mounting stability) is usually used on subcritical mounts. With this type of mounting, it is possible to damp impacts and shocks from relatively slow-moving machines such as mixers, crushers (cone crushers), punching presses, shears, etc. On machines with subcritical mounts, the resulting efficacy of the isolation insulation cannot be calculated – it can only be determined by comparing the values before and after.

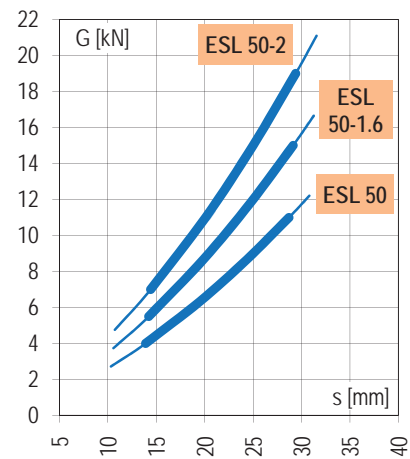

Resonance range

Any coincidence between the exciter frequency and the natural frequency of the damper lead to an undesired, uncontrollable swinging up of the machine to be stored.

Vibration dampers

ESL: Deflection curves and setting behaviour

The deflection graphs already contain an initial cold flow that occurs after the first hours of operation. The final cold flow is approx. $s \times 1.09$. These deflection values are based on our catalogue data and are to be taken as guidelines. Please also refer to our tolerance data in chapter 7 «Technology – ROSTA Basics».

ESL: Installation guidelines

The ESL elements must generally be installed in the same direction.

Dynamic forces longitudinal

Dynamic forces lateral

Wall mounting

(Please follow mounting direction)

Vibration dampers

400	6	8	8	8	10	12	14	16	16										
500	8	8	8	10	12	14	16												

Type	Max. absorption of energy per ESL
ESL 38	250 Nm
ESL 45	375 Nm
ESL 50	750 Nm
ESL 50-1.6	1 000 Nm
ESL 50-2	1 250 Nm

Transfer stations equipped with ROSTA Type ESL vibration dampers offer a progressive deflection characteristic that effectively dampens the kinetic energy created when the falling material makes impact. This protects the surface of the belt's coating from cracking, dramatically reduces the level of continuous material wear and protects the substructure from premature failure.

Vibration dampers

AWI: Deflection curves and setting behaviour

The deflection graphs already contain an initial cold flow that occurs after the first hours of operation. The final cold flow is approx. $s \times 1.09$. These deflection values are based on our catalogue data and are to be taken as guidelines. Please also refer to our tolerance data in chapter 7 «Technology – ROSTA Basics».

Tensioner devices

Tensioner device

Tensioning force F

Tensioning forces for lever position «normal» for SE/SE-G/SE-R/SE-F/SE-I

Size SE	Pre-tension $\leq 10^\circ$		Pre-tension $\leq 20^\circ$		Pre-tension $\leq 30^\circ$	
	F [N]	s [mm]	F [N]	s [mm]	F [N]	s [mm]
11	18	14	48	27	96	40
15	25	17	65	34	135	50
18	75	17	185	34	350	50
27	150	23	380	44	810	65
38	280	30	720	60	1500	88
45	520	39	1350	77	2650	113
50	740	43	2150	86	4200	125

The tensioning force can be continuously adjusted. The max. pre-tensioning angle is 30° out of neutral position.

When fixing the sprockets, riders and rollers in arm-position «hard», tensioning force will increase on about 25%.

SE-W: 40% lower tensioning force than standard versions (Rubmix 40).
SE-FE: see SE-FE in chapter 5.

Tightening torque M_A

	Quality 8.8	Quality 12.9 for SE-F/SE-FE
M6	10 Nm	17 Nm
M8	25 Nm	41 Nm
M10	49 Nm	83 Nm
M12	86 Nm	145 Nm
M16	210 Nm	355 Nm
M20	410 Nm	690 Nm
M24	750 Nm	

Table mentioning the tightening torque for the central screw (included in scope of delivery).

Tensioner devices

Installation guidelines

«Z» layout

If chain tensioning wheels/chain sliders or tension rollers are mounted on the outer lever side, the distance «Z» should be as low as possible. The maximum pre-tensioning force F should not exceed 50% (~20° pre-tensioning).

Use of SE-B Boomerang® tensioners

In very long chain and belt drives it was recommendable to install on the slack-side several tensioners, in order to compensate occurring elongation. The «Boomerang» with its bent double-arm equipped with two chain sprockets or a combination of grooved pulley and flat-roller (belt-drives) offers a triple-compensation of chain and belt elongations, due to S-shape contact-arc.

Assembly

The central screw is tightened slightly. The tensioner housing is set with a wrench and tightened in the desired direction. Then tighten the screw with the appropriate M_A tightening torque. Position the wrench near the flange bottom.

Chain or belt drives

Further assembly instructions specific for chain or belt drives on the following pages.

Installation guidelines for chain drives

Standard positioning

The ROSTA tensioning device should be placed on the slack-side of the chain drive, close by the smaller sprocket wheel in order to enlarge its contact-arc, therefore contact application from outer side of drive. In mounted position the tensioner-arm should stay close to parallel to the chain run, in drain direction. By extremely long chain drives it is recommendable to install several tensioners or the type «Boomerang®» in order to enlarge the slack compensation.

Reversible chain drive

On reversing chain drives, we recommend installing two chain tensioners, one per chain strand. Due to the constantly alternating slackening, depending on the direction of travel of the drive, both tensioners should only be pre-tensioned to a maximum of 20° to retain a free return angle of 10° when changing from the «slack section» to the «working section».

Sprocket teeth engaged

When tightening for the first time, at least 3 teeth of the sprocket must be engaged with the chain. The free length of the chain between tensioning wheel and the next sprocket should be at least 4 sections.

Chain track

The tensioner sprocket and the chain sliders should be positioned on the track between 2 nuts «C». The chain track can be precisely set by adjusting the setting range R . The lock nut «B» is always tight.

Installation guidelines for belt drives

1. Layout in belt drives

Tensioning from inside the belt drive with a V-belt pulley

- When installing in the slack section, both belt pulleys must have sufficient wrap angles (driver and driven).
- For vibration-intensive drives with very long centre distances, it is recommended use deep-grooved pulleys.

Tensioning with flat roller on the back of the belt

- Roll diameter should be at least 2/3 of the diameter of the smallest pulley.
- Roll width approx. 20% bigger than the overall width of the belt unit.
- When installing in the slack section, both belt pulleys must have sufficient wrap angles (driver and driven).

2. Selection of the ROSTA tensioner device

Reference values for the most common types of V-belts

* Required test-force for belt deflection of 16 mm per 1 000 mm of center distance. The relevant deflection by shorter or longer center distance is proportional to 16 mm/m. The values may vary depending on the belt supplier.

$$F = F_i \cdot z \cdot 2$$

F Resulting tensioning force by a SE pre-tension angle of 20° (see table «Tension force F»)

F_i Initial operation test-force

z Quantity of belts in drive

2 Multiplier e.g. to compensate for belt slip and/or of centrifugal force generated on the drive belts.

The operational test-force F_0 (after belt elongation) is around 20% lower than the initial test-force F_i . Therefore, we recommend to inspect the belt tension after a few days of operation.

** Please contact ROSTA

Tensioner devices

Installation guidelines for fast tension device SV

An additional drill hole (see drill hole specifications) is required for the swivel joint of the quick tensioning unit. The installation guidelines for the ROSTA tensioning element (e.g. position of the lever arm in relation to the chain or belt) must be observed. The quick pre-tensioning unit is to be attached to the tensioning element as deep as possible. Position the axis of rotation in the hole with the two nuts, but do not tighten it. Turn the pre-tensioning screw further until the ball is seated in the joint socket, which has been turned up to the stop in the pretensioning lever. The ball must be greased beforehand with a commercially available, graphitized or MoS₂-containing multipurpose grease. After the tensioning element has been pre-tensioned, the fastening screw of the tensioning element must be tightened.

The type SV quick tensioning unit can also be attached mirror-inverted or rotated by 90°.

Untensioned

approx. 20° pre-tensioned

Drill hole specification for the Fast tension device SV

Type	B	r	α
SV 15/18	Ø 8.5 mm	93 mm	50°
SV 27	Ø 10.5 mm	110 mm	50°
SV 38	Ø 10.5 mm	150 mm	40°
SV 45	Ø 17.0 mm	190 mm	45°
SV 50	Ø 17.0 mm	190 mm	45°

A = mounting hole or thread for the SE tensioner

B = hole for the eyebolt

Important

The ball socket should be screwed in as far as it will go in the pre-tensioning lever.

MOTORBASES

Motorbases

Usual positioning of the ROSTA motorbases

These recommendations are based on practical experience, a test run will show the ideal adjustment.

Vibrating screen applications

«Overhead» configuration

«Alongside» configuration

«Underneath» drive, feeder

Increased offset and larger Motorbase recommended.

Pump applications

«Overhead» configuration

Motor plate «off-set», towards the pretensioning device.

«Alongside» configuration

Crusher applications

Variable loads

Motor plate offset, in the direction of the pre-tensioning unit.

Range of application MB 27 and MB 38

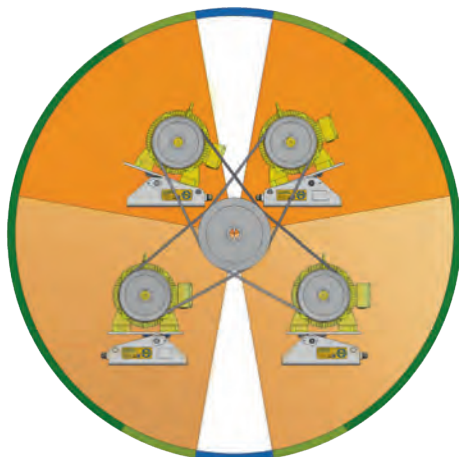

Longest tensioning path, ideal positioning range of the MB

Possible positioning range of the MB

Test forces for belt tensioning

The ROSTA motorbase MB can be precisely pre-tensioned by means of the mechanical pretensioner in accordance with the test force prescribed by the belt manufacturer. The standard values of the test forces for the most common V-belt profiles are listed in the table. This simplified way to determine the pre-tension is sufficient in most applications.

Exception

In the case of vibrating screens, only tighten the belts so far as to guarantee they won't slip at the start and when they are running.

* Required test-force for belt deflection of 16 mm per 1 000 mm of center distance. The relevant deflection by shorter or longer center distance is proportional to 16 mm/m. The values may vary depending on the belt supplier.

The operational test-force (after belt elongation) is around 20% lower than the initial test-force F_I . Therefore, we recommend to inspect the belt tension after a few days of operation.
